Overview

- What is version control and why do it?
- SVN versus GIT
- Subversion (**SVN**) in action at the command line
 - repositories
 - adding stuff
 - committing
 - handling conflicts and rolling back

Managing code in the olden days

...create “working_dir”

...add some code

...write some outputs

...change the code

!!Publish a paper!!

...change the code

...copy “working_dir” to “working_dir2”

...change the code

...copy a version to a CD

Now which version is current? Is it “working_dir” or “working_dir2”? And which one relates to that paper?

But those days are gone!

- Scientists are typically required to keep and publish their data and code (by their funders/institutions).
- Collaboration between scientists requires data-sharing; this implicitly relies on code-sharing.
- There are tools that make it easy to record our changes, document our workflow and “fix” releases of our code at important steps along the way.

Introducing Version Control Systems

“**Revision control**, also known as **version control** and **source control** is the management of changes to documents [and] computer programs. Changes are usually identified by a number or letter code, termed the "revision number" or simply "revision".

For example, an initial set of files is "revision 1". When the first change is made, the resulting set is "revision 2", and so on. Each revision is associated with a timestamp and the person making the change. Revisions can be compared, restored, and with some types of files, merged.” (from Wikipedia!)

GIT vs SVN

So, which VCS should you use?

- SVN is easier to comprehend
- GIT is more powerful
(and better for collaboration)

Keep it simple:

- What do your colleagues/collaborators use?
- What do your administrators support?

We use both at CEDA!

- git was initially designed for linux kernel development in 2005 and has since become the most widely adopted version control system for software development.
- Unlike client-server systems such as subversion, every git working directory is a fully-fledged repository with complete history and full version-tracking capabilities.
- git is independent of network access or a central server.

You can still do version control offline

- git software is free
- There are lots of online tools to help manage git repositories some of them have pictures of cats.
